Open your bag of rules and round to the specified number of significant figures by overestimating, if the last digit is eÅÅÅVÅ 5 or underestimating, if the last digit is < 5. 5.

3 significant figures: 10,546 = 10,500 . 2 significant figures: 10,546 = 11,000 (because of the "5" the number increases by 1) 1 significant figure: 10,546 = 10,000 (this is not 11,000 because it only asked for 1 significant figure, which looks to the second digit place to see if it increases or stays the same. The second digit place holds a ... Example 1: $\log 5.43 \times 10^{10} = 10.735$ The number has 3 significant figures, but its log ends up with 5 significant figures, since the mantissa has 3 and the characteristic has 2. Example 2: $\log 2.7 \times 10^{-8} = -7.57$ The number has 2 significant figures, but its log ends up with 3 significant figures. Natural logarithms work in the same way: Rounding to 1, 2, & 3 Significant Figures. Whether it is rounding decimals or whole numbers to 1, 2, or 3 significant digits got high school students busy watching out for decimals followed by leading, captured, or trailing zeros and counting sig-figs from the Pacific or Atlantic side and round off as specified.
