32 BOOKS For Pre + Mains 2021 Batch

1 Column Text (For reading on Laptop/Tablet/Mobile)

Besides the equator (0°), the north pole (90° N) and the south pole (90° S), there are four important parallels of latitudes:

- The Tropic of Cancer (23½° N) in the northern hemisphere.
- The Tropic of Capricorn (23½° S) in the southern hemisphere.
- The Arctic circle (66½° N) in the northern hemisphere.
- The Antarctic circle (66½° S) in the southern hemisphere.

2 Column Text (Print Friendly: For taking a Print Out)

1.1 Latitude or Parallel

Latitude is the angular distance of a place north or south of the equator measured in degrees from the centre of the earth.

As the earth is slightly flattened at the poles, the linear distance of a degree of latitude at the pole is a little longer than that at the equator.

For example, at the equator linear distance of a degree of latitude is 111.32 km (69 miles), at 45° it is 111.33 km (69 miles), and at the pole, it is 111.5 km (69 miles). The average is taken as 111 km (69 miles).

1.2 Longitude or Meridian

Longitude is an angular distance of a place east or west of the Prime Meridian measured in degrees from the centre of the earth.
