Width and depth

Width and depth of assortment. Width and depth meaning. Width and depth the same. Width and depth of beam. Width and depth of washer and dryer. Width and depth and height. Width and depth difference. Width and depth curtains.

Whenever I read this kind of 10³ (w) x5²³ (h) for a dimension of the product, I am confused what it means and it is difficult to imagine from time to time. Here, for my record, I put it here: this is the basic dimension of geometry: "e". Easy if you know. Dimension of geometry height width outside the mathematic class, the context usually guides our choice of vocabulary: the length of a rope, the width of a door, the height of a flagpole, the depth of a pool. But in describing the rectangles or brick-shaped objects, the choice of vocabulary seems less clear. Question: We must label the two dimensions of a length and width of the rectangle; or width and height; or even length and height? There is a length, width, height and depth of terms? Retains of various forms and positions. The choice of vocabulary here is entirely about clarity and lack of ambiguity. The mathematica does not prescribe rules on "e". "e" "e" "e" "e" "e" "e" "e" "e" "e" In mathematics as elsewhere, the objective of the specialized vocabulary is to serve a clear and unambiguous communication. In this case, our natural way of speaking will give us some guidelines. Length: If you choose to use the word length, it should refer to the longest rectangle dimension. Think about how you would describe the distance along a road: it is the long distance, the duration of the road. (Words along, long and length are all related.) The distance on the other side of the road counts as the road is from side to side. This is the width of the road. (Width words and width are also related.) When a rectangle is drawn "e" "e" "e" on the page, so it is usually clearer to Labeling the long side - "e" "Length" "e" "e" and the other side "e". "Width" "e" "e" as if you were labeling a road. Inclined rectangle. Height: When a rectangle is drawn with horizontal and vertical sides, the word height makes clear which dimension is meant; Height rigules how high (how high) is the rectangle. This makes it easy to indicate the other dimension - how width is the rectangle side by side - using the width of the word. And if the side measurement to the side is greater than the height, calling it from the length of the retainer is also acceptable, since it does not create confusion. Retains of several orientations. Note that in this case when the height is used, the comparative size does not matter. Because the height is always vertical, measured, width or height, can be higher. When the height of the word is used in conjunction with the base, it has a specific meaning that does not necessarily refer to a vertical measurement. For some non-rectangular forms, the length, the height or width of the terms would remain clear, explicitly showing what you mean - and consult it as "e" "e" or "e" "e" "e". "This measure. Three dimensions by naming dimensions of a three-dimensional figure, the only rule is to make sense and be clear. This will help us use Rotters. When the figure is "e" Level "e" "e" "height clearly refers to the vertical dimension "e" "e" how high the figure is "e" "e". Regardless of this dimension is greater or less or something in the middle; length (if you use the word) refers to more time of the other two dimensions. But you can also refer to other dimensions as width and depth (and these are virtually interchangeable, depending on what "the following" are wide or deep on the figure). See these examples. When the height would not be clear, for example, if the figure does not The "e" "e" "e" "e" "e" "e" "e" "e" "e" "People can not know what is meant by width, depth or height without riots, although the length is usually presumed to refer to the longest measurement in the figure. And, as in two dimensions, terms like "e" "e" "length" "e" "e" "e" "e" "e" "e" will feel natural or clear to forms, like a ball of tons. What in a word? Length, width, height and depth are substantive are derived from long, wide, high and deep adjectives. They follow an English ordinary pattern that involves a change of vowel (often for a one vowel) and th advance. (OT Lone in height is modern. The obsolete forms include Heighth and Herthh, and it is still common to listen to people to pronounce it that way.) High high width long width deep height wide width Other English couple adjective -Substantivo are related in this very: for example, Hale as in "e" "e" "e" "e" and the healthy (but Hale, except in this expression, is now replaced by "e" "e" "Realization - "e" "e").
