Always smiled, with the perfect hair and outfit she made herself. A real lady – in every sense of the word. The perfect she was, calm and smiled, she set me down and the first thing she asked was: "Are you sure?" – Yes, I said. If I could only tell you how much useful advice came out from the mouth of a person who has no college degree! But she was and still is the smartest person I've ever met! You would love her!If you want to do something you need to be talented, that's for sure. But the talent is just 10 percent of everything. The biggest part is goodwill and a lot of work. When it comes to sewing, besides these two things there is one more very important – the machine!My grandma was a seamstress. She said – Singer machines rule! And that's how I've decided to buy that one exactly!Why Singer?This is the company with perennial experience in the production of sewing machines. Their endurance shows they know what they're doing. The company was established in the 1800s and today it is one of the leaders in this field. Simply saying long history – very important! These machines are famous all over the world. They are absolute rulers in the world of sewing. Fashion designers love them, seamstresses as well... I love them, seamstresses as well... I love them, too. Very important - how to oil a Singer sewing machine? Most Singer sewing machines use oil. We talked about the reasons for oiling and cleaning your sewing machine regularly and on time. You don't do it for nothing – you do it to make your machine works perfectly. When you clean it and oil it on time it will be more effective, productive and it will run more quietly. Get this – there are a few steps you need to follow. If you stick to them I promise you won't need any professional help. You'll do it yourself, in the comfort of your home. How do I oil my sewing machine - step by step Let's check out the necessary steps. Step 1 - choosing the oilChoosing the oilChoosing the right oil is not only the first but maybe the most important step for oiling a Singer sewing machine is different so you need to be extra careful about this. You should check which oil is required and get that one. This won't be the problem since with every machine there is a manual. Read it before you start doing anything!f, on the other hand, you buy a secondhand Singer or any other sewing machine, find the manual on the internet. Read it thoroughly!Most manuals today give you a precise description of every step. Some even have pictures. There are machines that you don't have to oil - they do it themselves. If, again, your machine needs to be oiled but your machine after you have used it approximately 10 – 15 times. When can you be sure your machine needs oiling – when you notice that lint started to gather. What's sure? If your machine doesn't work properly, the first thing you have to do is clean it. If your machine isn't clean, it won't be lubricated well. Turn off your machine. Remove all the pieces possible (needles, bobbins, threads, and a presser foot). To clean you'll need a firm but lint brush. Before you start oiling clean your machine as well as possible, part by partThere is a lot of dust inside your machine so a dust spray is a must-have. You can use it to clean a bobbin and a bobbin case as well as other hardly reachable parts. Use the dust remover even under the needle plate. You won't believe how much dust there is in your sewing machine are always crabby places, hard to reach. If you run into this problem feel free to use tweezers. They can be guite helpful in these situations. There are parts you can simply wipe with a piece of cotton cloth. Always bear in mind that cleaning the machine properly is essential! There are other ways to clean. I saw some people using compressed air. I personally never had the guts to try that? That, I'll leave up to you. Step 4 – how much oil you need Before you start, place something like a piece of cloth or paper under your machine. This way you'll avoid the mess. You're probably not sure how much oil is enough. If you get stuck in this situation take it slowly. First, pour a little and then add more if it's necessary. Parts that need to be oiled can usually be separated. To make sure you haven't made a mistake always follow the manual. Brush each part separately and then oil it. Don't rush — take as much time as you need. When you finish the oiling process, get the pieces back together. Step 5 - oilingFirst - of course - buy the oil. For the right one check out your manual. It's not hard to find it. It is usually packed in small bottles but you don't need God knows how much for one oiling so it will last - no worries! Where can you buy it? Logically - sewing shops. There are other places you can find this oil but the safest is to go to the sewing shop. There you'll surely find it. Please, use only sewing machine oil. It is different from other oils you might have (such as car oil). Never use too much oil. Squeeze the bottle slowly and pour a few drops. On Singer sewing machine first thing you need to do is to remove the needle plate. There is the handwheel you need to turn until you fully raise the needle. After you've done this, open the hinged front cover. Your machine comes with the screwdriver you need. Use it to unscrew the bobbin case, the hook cover, and the hook itself. Clean them with a cotton cloth we mentioned. Manual will show where you should put the oil exactly. A drop or two will be enough. This is a good chance to replace the needle (since everything is already separated). This is my advice, but replacing needles is also very important if you want your job done fast and well. After you have finished oiling do all these things vice versa and the oiling process is done. Your machine is now cleaned, oiled, and ready to be used. Oiling other sewing machinesDepending on a brand there are different ways of oil into the housing unit (bobbin case sits right in it). There is also a little thing that spins inside the bobbin case called a shuttle hook. Oil it as well. Oil the hook race and the housing, too. This is good because if you do this your machine will be quieter. Cleaning partWe've talked about oiling the machine so the mess is expected. You don't use too much oil so it won't be like when changing the oil in your car but nevertheless. Precautions are ok. Before you start doing anything, put something under the machine (we talked about it). Be careful when squeezing the oil – firstly because you need only 1 – 2 drops and secondly to avoid the mess. After you have finished oiling, clean the oil from all places and parts that shouldn't be oiled with soft cotton. This way you won't mess up your next project. What oil to use for sewing machinel've talked about the importance of oiling your sewing machine on regular basis but there's no harm in saying it again. There is the approximate value of viscosity (18 – 20cST) considered well for sewing machine oil. Viscosity actually represents the level of thickness. One more important thing is a chemical structure. There are additives that can improve the quality of oil and their characteristics it's completely up to you which one you'll choose. Just, before you buy it read the label check its components, and check if there is a special type your manufacturer suggests. Then you decide. Why is so important to choose the right sounds a little bit extreme (like shoes have something to do with oiling) but it is very important. Imagine that you bought a nice pair of shoes, but they don't fit you. They are too small, or too big.Well, the same can happen with the oil for your machine.
