# The practice of statistics third edition answers

This page includes .pdfs of the packets, handouts, worksheets, activities, etc. used with Yates, Moore, Starnes "The Practice of Statistics, 3rd Edition" in AP Statistics at LSHS. Teachers, feel free to use any or all files on this site in your classes. If you have a file you would like to share, email me and I will post it on this page. Note: Presentations were created in Apple's "Keynote" and are available in .pdf format and Powerpoint. Caution, some fonts and transitions may not transfer to .ppt. Quick Reference YMS3e Chapter Assignment & Pacing Guides ChPGuide Ch1Guide Ch2Guide Ch3Guide Ch4Guide Ch5Guide Ch6Guide YMS Vocabulary Crossword Puzzles Free Response AP Problems. Yay! Past AP FRQs used for review and exam prep: Jeopardy! PowerPoint Reviews Note: These are NOT my creations. Credit is given to the individuals who emailed them to me. Second Semester Chapter 9: Sampling Distributions Chapter 10: Estimating with Confidence Chapter 11: Testing a Claim Chapter 12: Significance Tests in Practice Chapter 13: Comparing Two Parameters Chapter 14: Chi Square Procedures Chapter 15: Regression Reading Guide: Chapter 15 - Edgar Fong The Practice of Statistics, 3rd Ed. (TPS3e) zip file of all TPS2e packets in Apple "Pages" Format Arithmetic mean The arithmetic mean of a set of numbers  $x_1, x_2, \dots, x_n$  is their sum divided by the number of observations, or  $(\sum_{i=1}^n x_i) / n$ . The arithmetic mean is usually denoted by  $\bar{x}$ , and is often called the average. Assignable cause The portion of the variability in a set of observations that can be traced to specific causes, such as operators, materials, or equipment. Also called a special cause. Attribute A qualitative characteristic of an item or unit, usually arising in quality control. For example, classifying production units as defective or nondefective results in attributes data. Causal variable When  $y = f(x)$  and  $y$  is considered to be caused by  $x$ ,  $x$  is sometimes called a causal variable. Chance cause The portion of the variability in a set of observations that is due to only random forces and which cannot be traced to specific sources, such as operators, materials, or equipment. Also called a common cause. Confounding When a factorial experiment is run in blocks and the blocks are too small to contain a complete replicate of the experiment, one can run a fraction of the replicate in each block, but this results in losing information on some effects. These effects are linked with or confounded with the blocks. In general, when two factors are varied such that their individual effects cannot be determined separately, their effects are said to be confounded. Consistent estimator An estimator that converges in probability to the true value of the estimated parameter as the sample size increases. Contrast A linear function of treatment means with coefficients that total zero. A contrast is a summary of treatment means that is of interest in an experiment. Cook's distance In regression, Cook's distance is a measure of the influence of each individual observation on the estimates of the regression model parameters. It expresses the distance that the vector of model parameter estimates with the  $i$ th observation removed lies from the vector of model parameter estimates based on all observations. Large values of Cook's distance indicate that the observation is influential. Correlation coefficient A dimensionless measure of the linear association between two variables, usually lying in the interval from  $-1$  to  $+1$ , with zero indicating the absence of correlation (but not necessarily the independence of the two variables). Cumulative sum control chart (CUSUM) A control chart in which the point plotted at time  $t$  is the sum of the measured deviations from target for all statistics up to time  $t$ . Curvilinear regression An expression sometimes used for nonlinear regression models or polynomial regression models. Defects-per-unit control chart See U chart. Deining relation A subset of effects in a fractional factorial design that define the aliases in the design. Deming W. Edwards Deming (1900–1993) was a leader in the use of statistical quality control. Distribution free method(s) Any method of inference (hypothesis testing or confidence interval construction) that does not depend on the form of the underlying distribution of the observations. Sometimes called nonparametric method(s). Enumerative study A study in which a sample from a population is used to make inference to the population. See Analytic study. Experiment A series of tests in which changes are made to the system under study. Factorial experiment A type of experimental design in which every level of one factor is tested in combination with every level of another factor. In general, in a factorial experiment, all possible combinations of factor levels are tested. Fixed factor (or fixed effect). In analysis of variance, a factor or effect is considered fixed if all the levels of interest for that factor are included in the experiment. Conclusions are then valid about this set of levels only, although when the factor is quantitative, it is customary to fit a model to the data for interpolating between these levels.
